

Math 3  
Unit 3 Day 1 Notes - Intro to Polynomials

Name: Key  
Date: \_\_\_\_\_

All Polynomials must have whole numbers as exponents!!  
Example:  $9x^{-1} + 12x^{\frac{1}{2}}$  is NOT a polynomial.

Polynomial Vocabulary Review

- Expression: **Numbers, symbols, and operators grouped together that show the value of something.**  $2x + 3$
- Equation: **An equation says that two things are equal. It will have an equal sign.**  $7x + 2 = 10x + 1$
- Terms: **A single number or variable, or numbers and variables multiplied together; they are separated by plus or minus signs.**
  - Monomial, Binomial, Trinomial, Polynomial
    - one term
    - two terms
    - three terms
    - 4 or more terms
- Degree: **The highest exponent of a polynomial expression or equation.**
  - Constant, Linear, Quadratic, Cubic, Quartic, Quintic  
Degree:
    - 0
    - 1
    - 2
    - 3
    - 4
    - 5

Example 1: Classifying Polynomials

POLYNOMIAL	NUMBER OF TERMS	CLASSIFICATION BY TERMS	DEGREE	CLASSIFICATION BY DEGREE	SKETCH THE GRAPH
$f(x) = 5x^0$	1	monomial	0	constant	
$g(x) = 4x - 3$	2	binomial	1	Linear	
$p(x) = -2x^5$	1	monomial	5	Quintic	
$w(x) = x^4 - 4x + 2$	3	trinomial	4	Quartic	
$y = -4x^2 + x + 9$	3	Trinomial	2	Quadratic	
$h(x) = 4x^3 + x^2 - 9x + 2$	4	Polynomial	3	Cubic	

The number "k" is said to be a **zero of a polynomial** if  $f(k) = 0$ .

- "k" is often referred to as the **root or solution**
- If "k" is a **real number**, then  $f(k) = 0$  means that the graph **crosses the x-axis** at that value. "k" can also be referred to as an **x-intercept**

Check out the graphs below and identify any values that represent a zero/solution/root.

A.  
factored equation:  $\frac{(x+2)(x+0)(x-1)}{x(x+2)(x-1)}$

C.  
factored equation:  $(x+3)(x+1)(x-1)(x-3)$

B.  
factored equation:  $(x+3)(x+2)(x+1)(x-1)$

D.  
factored equation:  $(x+2)(x+1)(x-2)(x-3)(x-4)$

**WATCH OUT! Multiplicities of Zeros**

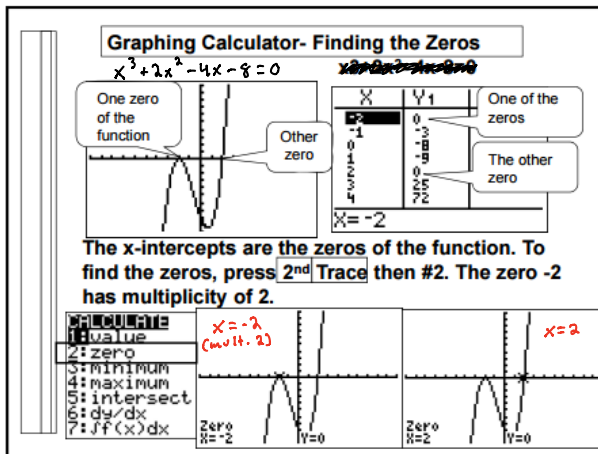

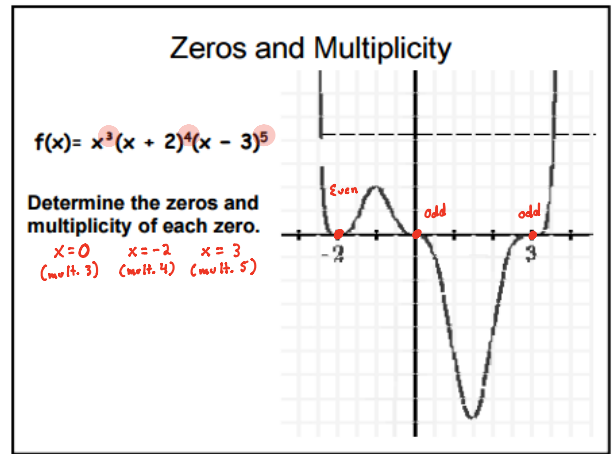

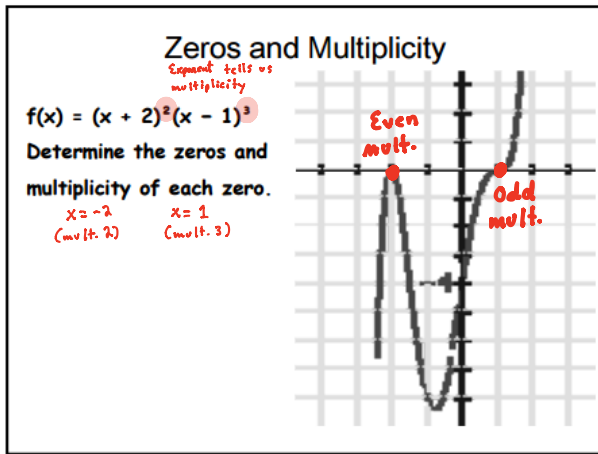

If  $c$  is a zero of the function  $P$  and the corresponding factor  $(x - c)$  occurs exactly  $m$  times in the factorization of  $P$  then we say that  $c$  is a zero of **multiplicity**  $m$ . One can show that the graph of  $P$  **crosses the x-axis at  $c$  if the multiplicity  $m$  is odd and does not cross the x-axis if  $m$  is even.**

**Shape of the Graph Near a Zero of Multiplicity  $m$**

Suppose that  $c$  is a zero of  $P$  of multiplicity  $m$ . Then the shape of the graph of  $P$  near  $c$  is as follows.

Multiplicity of $c$	Shape of the graph of $P$ near the $x$ -intercept $c$
$m$ odd, $m > 1$	<div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p><b>Cubic</b></p> </div> <div>OR</div> <div style="text-align: center;"> <p><b>Cubic</b></p> </div> </div>
$m$ even, $m > 1$	<div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p><b>Quadratic</b></p> </div> <div>OR</div> <div style="text-align: center;"> <p><b>Quadratic</b></p> </div> </div>

### Example

- Find all zeros of  $f(x)$  and state the multiplicity of each zero. State whether the graph crosses the x-axis, or touches the x-axis and turns around, at each zero.
- $f(x) = x^3 + 5x^2 - 9x - 45$

$x = -3$        $x = -5$        $x = 3$

### Example

Find the zeros of  $f(x) = 3(x + 5)(x + 2)^2$  and give the multiplicity of each zero. State whether the graph crosses the x-axis or touches the x-axis and turns around at each zero.

$x = -5$        $x = -2$   
 (mult. 2)

The high and low points on a graph are called the **extrema** of the function. An extremum that is higher or lower than any other points nearby is called a relative extremum.

A **relative extremum** (the plural of extremum is extrema) that is higher than points nearby is called relative maximum. A relative extremum that is lower than points nearby is called a relative minimum.

A function's **absolute extremum** occurs at the highest or lowest point on a function. The highest point on a function is called the absolute maximum and the lowest point on a function is called the absolute minimum.

Can you identify these in the graphs on the previous page?

The **end behavior** of a polynomial is a description of what happens as  $x$  becomes large in the positive or negative direction. For any polynomial, the end behavior is *determined by the term that contains the highest power of  $x$* , because when  $x$  is large, the other terms are relatively insignificant in size.

For example, the monomial  $y = x^2$  has the following end behavior:

~~$x \rightarrow -\infty, y \rightarrow -\infty$~~  and  ~~$x \rightarrow \infty, y \rightarrow -\infty$~~

UP (left) and UP (right)

Even Polynomials

$x \rightarrow -\infty, y \rightarrow \infty$  and  $x \rightarrow \infty, y \rightarrow \infty$

UP (left) and UP (right)

The monomial  $y = x^3$  has the following end behavior:

~~$x \rightarrow -\infty, y \rightarrow -\infty$~~  and  ~~$x \rightarrow \infty, y \rightarrow \infty$~~

DOWN (left) and UP (right)

Odd polynomials

$x \rightarrow -\infty, y \rightarrow \infty$  and  $x \rightarrow \infty, y \rightarrow -\infty$

DOWN (left) and UP (right)

### End Behavior of Polynomials

The end behavior of the polynomial  $P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$  is determined by the degree  $n$  and the sign of the leading coefficient  $a_n$ , as indicated in the following graphs.

$P$  has odd degree

Leading coefficient positive      Leading coefficient negative

$P$  has even degree

Leading coefficient positive      Leading coefficient negative

Given the graph of the polynomial below

- State the intervals where the graph is **increasing/decreasing** (think "slope")
  - Increasing:  $(-\infty, -2)$   
 $(0, \infty)$
  - Decreasing:  $(-2, 0)$
- State the intervals where the graph is **positive/negative** (above/below the  $x$ -axis)

Positive:  $(-3, -1)$   
 $(1, \infty)$

Negative:  $(-\infty, -3)$   
 $(-1, 1)$
