

Triangle: a polygon w/ three sides

Classifying Triangles by its Sides:

Classifying Triangles by its Angles:

Equiangular Triangle: a triangle w/ three congruent angles

Triangle Sum Theorem:

the sum of the measures of the interior angles of a triangle is 180°

$$m\angle 1 + m\angle 2 + m\angle 3 = 180$$

Corollary to the Triangle Sum Theorem:

The acute angles of a right triangle add up to 90°

$$m\angle 4 + m\angle 5 = 90$$

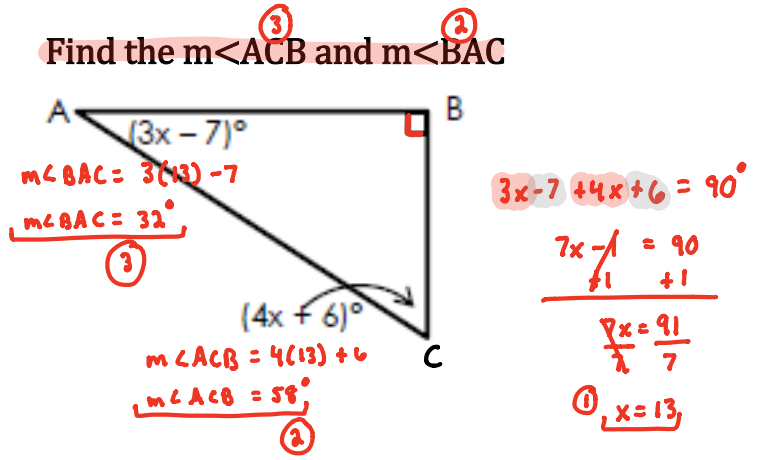

Examples:

Find the value of x

$$\begin{aligned}
 2(8x-2) + 7x &= 180^\circ \\
 16x - 4 + 7x &= 180^\circ \\
 23x - 4 &= 180 \\
 +4 & \quad +4 \\
 \hline
 23x &= 184 \\
 \frac{23x}{23} &= \frac{184}{23} \\
 \underline{x = 8}
 \end{aligned}$$

Find the $m\angle ACB$ and $m\angle BAC$

$$\begin{aligned}
 m\angle BAC &= 3(13) - 7 \\
 \underline{m\angle BAC} &= \underline{32^\circ} \\
 \textcircled{3}
 \end{aligned}$$

$$\begin{aligned}
 m\angle ACB &= 4(13) + 6 \\
 \underline{m\angle ACB} &= \underline{58^\circ} \\
 \textcircled{2}
 \end{aligned}$$

$$\begin{aligned}
 3x - 7 + 4x + 6 &= 90^\circ \\
 7x - 1 &= 90 \\
 +1 & \quad +1 \\
 \hline
 7x &= 91 \\
 \frac{7x}{7} &= \frac{91}{7} \\
 \textcircled{1} \underline{x = 13}
 \end{aligned}$$

Exterior Angle Theorem:

The measure of an exterior angle of a triangle is equal to the sum of the measures of the two non-adjacent interior angles.

$$m\angle 1 + m\angle 2 = m\angle 4$$

Example:

Find the measure of the exterior angle shown

$$\begin{aligned}
 4(29) + 12 &= 128^\circ \\
 \underline{\hspace{1.5cm}} & \quad \textcircled{2}
 \end{aligned}$$

$$\begin{aligned}
 \cancel{2x} + 70 &= 4x + 12 \\
 -\cancel{2x} & \quad -2x \\
 \hline
 70 &= 2x + 12 \\
 -12 & \quad -12 \\
 \hline
 58 &= \frac{2x}{2} \\
 \frac{58}{2} &= \frac{2x}{2} \\
 \textcircled{1} \underline{x = 29}
 \end{aligned}$$
